Computational Photography

Hendrik Lensch, Summer 2007

## Metering

- determine exposure time and aperture
- referenced to a standard 18% grey reflector

Computational Photography

Hendrik Lensch, Summer 2007

## In Camera Metering

inherent problem:

- camera measures reflected light
- depends on object's reflectance

Computational Photography

Hendrik Lensch, Summer 2007

## In Camera Metering

- still dependent on scene reflectance
- use of reference card

[[www.cambridgeincolour.com](http://www.cambridgeincolour.com)]

Computational Photography

Hendrik Lensch, Summer 2007

## Exposure Bracketing

- capture additional over and underexposed images

Computational Photography

Hendrik Lensch, Summer 2007

## Exposure Bracketing

- capture additional over and underexposed images

Computational Photography

Hendrik Lensch, Summer 2007

## Exposure Bracketing

- capture additional over and underexposed images
- how much variation?
- how to combine?

Computational Photography

Hendrik Lensch, Summer 2007

## Dynamic Range in Real World Images

- natural scenes: 18 stops ( $2^{18}$ )
- human: 17 stops (after adaptation 30 stops  $\sim 1:1,000,000,000$ )
- camera: 10-16 stops

[Stumpf et al. 00]

Computational Photography

Hendrik Lensch, Summer 2007

## Dynamic Range of Cameras

example: photographic camera with standard CCD sensor

- |  |                      |
|--|----------------------|
| dynamic range of sensor  | 1:1000               |
| exposure variation (handheld camera/non-static scene): $1/60^{\text{th}}$ s – $1/6000^{\text{th}}$ s exposure time | 1:100                |
| varying aperture f/2.0 – f/22.0  | $\sim 1:100$         |
| exposure bias/varying "sensitivity"  | 1:10                 |
| <b>total (sequential)</b>  | <b>1:100,000,000</b> |

simultaneous dynamic range still only 1:1000  
similar situation for analog cameras

Computational Photography

Hendrik Lensch, Summer 2007

## High Dynamic Range (HDR) Imaging

basic idea of multi-exposure techniques:

- combine multiple images with different exposure settings
- makes use of available sequential dynamic range

other techniques available (e.g. HDR video)

Computational Photography

Hendrik Lensch, Summer 2007

## OECE Test Chart

### absolute calibration

Computational Photography

Hendrik Lensch, Summer 2007

## High Dynamic Range Imaging

- limited dynamic range of cameras is a problem
  - shadows are underexposed
  - bright areas are overexposed
  - sampling density is not sufficient
- some modern CMOS imagers have a higher and often sufficient dynamic range than most CCD imagers

Computational Photography

Hendrik Lensch, Summer 2007

## High Dynamic Range (HDR) Imaging

- analog film with several emulsions of different sensitivity levels by Wyckoff in the 1960s
  - dynamic range of about  $10^6$
- commonly used method for digital photography by Debevec and Malik (1997)
  - selects a small number of pixels from the images
  - performs an optimization of the response curve with a smoothness constraint
- newer method by Robertson et al. (1999)
  - optimization over all pixels in all images

Computational Photography

Hendrik Lensch, Summer 2007

## High Dynamic Range Imaging

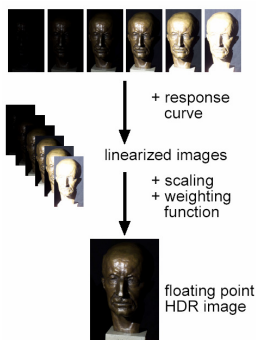

general idea of High Dynamic Range (HDR) imaging:

- combine multiple images with different exposure times
  - pick for each pixel a well exposed image
  - response curve needs to be known
  - don't change aperture due to different depth-of-field

Computational Photography

Hendrik Lensch, Summer 2007

## High Dynamic Range Imaging

Computational Photography

Hendrik Lensch, Summer 2007

## HDR Imaging [Robertson et al.99]

Principle of this approach:

- calculate a HDR image using the response curve
- find a better response curve using the HDR image (to be iterated until convergence)

Computational Photography

Hendrik Lensch, Summer 2007

## HDR Imaging [Robertson et al.99]

input:

- series of  $i$  images with exposure times  $t_i$  and pixel values  $y_{ij}$

$$y_{ij} = f(t_i x_j)$$

task:

- find irradiance (luminance)  $x_j$
- recover response curve  $I(y_{ij})$

$$f^{-1}(y_{ij}) = t_i x_j = I_{y_{ij}}$$

Computational Photography

Hendrik Lensch, Summer 2007

## HDR Imaging [Robertson et al.99]

input:

- series of  $i$  images with exposure times  $t_i$  and pixel values  $y_{ij}$
  - a weighting function  $w_{ij} = w_{ij}(y_{ij})$  (bell shaped curve)
  - a camera response curve  $I(y_{ij})$ 
    - initial assumption: linear response
- ⇒ calculate HDR values  $x_j$  from images using

$$x_j = \frac{\sum_i w_{ij} t_i I_{y_{ij}}}{\sum_i w_{ij} t_i^2}$$

Computational Photography

Hendrik Lensch, Summer 2007

## HDR Imaging [Robertson et al.99]

optimizing the response curve  $I(y_{ij})$  resp.  $I(m)$ :

- minimization of objective function  $O$

$$O = \sum_{i,j} w_{ij} (I_{y_{ij}} - t_i x_j)^2$$

using Gauss-Seidel relaxation yields

$$I_m = \frac{1}{\text{Card}(E_m)} \sum_{i,j \in E_m} t_i x_j$$

$$E_m = \{(i, j) : y_{ij} = m\}$$

- normalization of  $I$  so that  $I_{128} = 1.0$

Computational Photography

Hendrik Lensch, Summer 2007

## HDR Imaging [Robertson et al.99]

both steps

- calculation of a HDR image using  $I$
  - optimization of  $I$  using the HDR image
- are now iterated until convergence
- criterion: decrease of  $O$  below some threshold
  - usually about 5 iterations

Computational Photography

Hendrik Lensch, Summer 2007

## HDR Imaging [Robertson et al.99]

Computational Photography

Hendrik Lensch, Summer 2007

## Example: Capturing Environment Maps

Computational Photography

Hendrik Lensch, Summer 2007

## Example: Capturing Environment Maps

Computational Photography

Hendrik Lensch, Summer 2007

## Weighting Function [Robertson et al.99]

choice of weighting function  $w(y_{ij})$  for response recovery

- for 8 bit images  $w_{ij} = \exp\left(-4 \frac{(y_{ij} - 127.5)^2}{127.5^2}\right)$
- possible correction at both ends (over/underexposure)
- motivated by general noise model

Computational Photography

Hendrik Lensch, Summer 2007

## Weighting function [Robertson et al.03]

choice of weighting function  $w(y_{ij})$  for HDR reconstruction

- introduce certainty function  $c$  as derivative of the response curve with logarithmic exposure axis
- approximation of response function by cubic spline to compute derivative

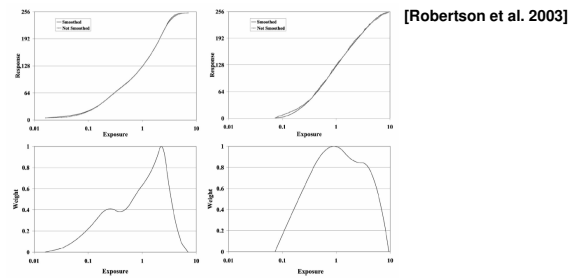

$$w_{ij} = w(y_{ij}) = c(I_{y_{ij}})$$

Computational Photography

Hendrik Lensch, Summer 2007

## Algorithm of Robertson et al.

- consider response curve gradient
- what would be the best curve based on noise?

Computational Photography

Hendrik Lensch, Summer 2007

## Algorithm of Robertson et al.

discussion

- method very easy
- doesn't make assumptions about response curve shape
- converges fast
- takes all available input data into account
- can be extended to >8 bit color depth
- 16bit should be followed by smoothing

Computational Photography

Hendrik Lensch, Summer 2007

## Input Images for Response Recovery

my favorite:

- grey card, out of focus, smooth illumination gradient

advantages

- uniform histogram of values
- no color processing or sharpening interfering with the result

Computational Photography

Hendrik Lensch, Summer 2007

## Input Images for HDR Generation

how many images are necessary to get good results?

- depends on scene dynamic range and on quality requirements
- most often a difference of two stops (factor of 4) between exposures is sufficient
- [Grossberg & Nayar 2003]

Computational Photography

Hendrik Lensch, Summer 2007

## HDR-Video

- LDR [Bennett & McMillan 2005]
- HDR image formats [OpenExr, HDR JPEG]
- HDR MPEG Encoding [Mantiuk et al. 2004]
- HDR + motion compensation [Kang et al. 2003]

Computational Photography

Hendrik Lensch, Summer 2007

## White Balance

capture the spectral characteristics of the light source to assure correct color reproduction

Computational Photography

Hendrik Lensch, Summer 2007

## White Balance

build-in function  
derive scale from white point

Computational Photography

Hendrik Lensch, Summer 2007

## White Balance

build-in function  
derive scale from white point

Computational Photography

Hendrik Lensch, Summer 2007

## White Balance

build-in function  
derive scale from white point

Computational Photography

Hendrik Lensch, Summer 2007

## ICC Profiles

(ICC –international color consortium)

- color management system
- capture the properties of all devices
  - camera and lighting
  - monitor settings
  - output properties
- common interchange space
- sRGB standard as a definition of RGB

Computational Photography

Hendrik Lensch, Summer 2007

## ICC Profiles and HDR Image Generation

- profile connection spaces
  - CIELAB (perceptual linear)
  - linear CIEXYZ color space
- can be used to create a high dynamic range image in the profile connection space
- allows for a color calibrated workflow

Computational Photography

Hendrik Lensch, Summer 2007

## 3-Chip CCD

- a prism splits up the incoming image into RGB images
- each color channel is captured by a different sensor
- registration during production
- problems with polarized light

Computational Photography

Hendrik Lensch, Summer 2007

## Color Wheel

- one color channel is captured at one shot
- 3 times the acquisition time
- static images only

Sequential Color Three-Pass CCD Imaging System

Figure 1

Computational Photography

Hendrik Lensch, Summer 2007

## Foveon Technology

- 3 layers capture RGB at the same location
- takes advantage of silicon's wavelength selectivity
- light decays at different rates for different wavelengths
- multilayer CMOS sensor gets 3 different spectral sensitivities
- don't get to choose the curves

Computational Photography

Hendrik Lensch, Summer 2007

## Ways to sense color

### Color filter array

- paint each sensor with an individual filter
- requires just one chip but loses some spatial resolution
- "demaosaicing" requires tricky image processing

primary

secondary

Computational Photography

Hendrik Lensch, Summer 2007

## Multi-Shot

- take four images, moving the sensor by one pixel
- (use fourth image for noise reduction)

- can be used for supersampling (move by  $\frac{1}{2}$ ,  $\frac{1}{4}$  pixel)

Computational Photography

Hendrik Lensch, Summer 2007

## Demosaicing

mosaic image

Bilinear interpolation  
[Alleysson & Suesstrunk05]

Computational Photography

Hendrik Lensch, Summer 2007

## Demosaicing

- bilinear interpolation
- sampling theory
- edge-directed/pattern-based interpolation
- correlation-based

Computational Photography

Hendrik Lensch, Summer 2007

## Bilinear Interpolation

perform interpolation for each color channel separately

Computational Photography

Hendrik Lensch, Summer 2007

## Bilinear Interpolation

$$R_{23} = \frac{R_{12} + R_{14} + R_{32} + R_{34}}{4}$$

Computational Photography

Hendrik Lensch, Summer 2007

## Bilinear Interpolation

$$R_{23} = \frac{R_{12} + R_{14} + R_{32} + R_{34}}{4}$$

$$R_{33} = \frac{R_{32} + R_{34}}{2}$$

Computational Photography

Hendrik Lensch, Summer 2007

## Bilinear Interpolation

set all non-measured values to zero then convolve

$$F_{R,B} = \begin{bmatrix} 1 & 2 & 1 \\ 2 & 4 & 2 \\ 1 & 2 & 1 \end{bmatrix} / 4 \quad F_G = \begin{bmatrix} 0 & 1 & 0 \\ 1 & 4 & 1 \\ 0 & 1 & 0 \end{bmatrix} / 4$$

Computational Photography

Hendrik Lensch, Summer 2007

## Problem: Aliasing

[Alleyson & Suesstrunk05]

Computational Photography

Hendrik Lensch, Summer 2007

## Problem: Aliasing

[Alleyson & Suesstrunk05]

Computational Photography

Hendrik Lensch, Summer 2007

## Luminance and Chrominance

[Alleyson & Suesstrunk05]

Luminance is sampled at every pixel

Chrominance (opponent colors) only available on a sparser grid (zero mean)

$$I = \{C_i(x, y)\} = \Phi(x, y) + \{\Psi_i(x, y)\}$$

$$\Phi(x, y) = \sum_{i \in \{R,G,B\}} p_i C_i(x, y) \quad \text{low-pass}$$

$$\Psi_i(x, y) = (1 - p_i) C_i(x, y) - \sum_{j \neq i} p_j C_j(x, y) \quad \text{high-pass}$$

one possible set for Bayer patterns:

$$\{p_R = \frac{1}{4}, p_G = \frac{1}{2}, p_B = \frac{1}{4}\}$$

Computational Photography

Hendrik Lensch, Summer 2007

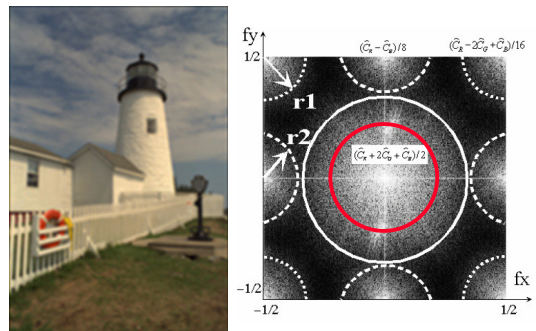

## Fourier Space

Computational Photography

Hendrik Lensch, Summer 2007

## Excessive Blurring

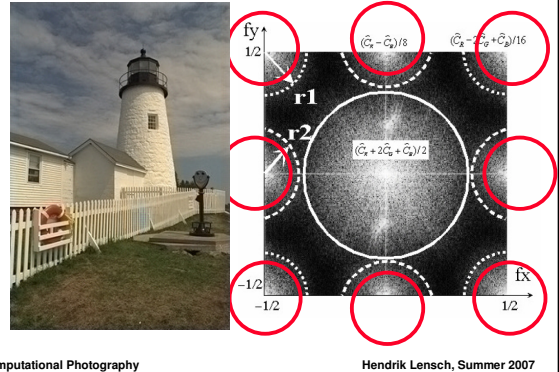

Computational Photography

Hendrik Lensch, Summer 2007

## Grid Effect

## Watercolors

## False Color

## [Alleyson & Suesstrunk05]

optimize r1 and r2 to gain best separation

- Low-pass filter luminance
- High-pass filter chrominance (orthogonal filter)
- Demultiplex chrominance
- Interpolate opponent colors
- Add luminance and interpolated colors

Computational Photography

Hendrik Lensch, Summer 2007

## Gradient-based (dcrw)

[Chuang et al. 99]

1. Calculate gradients in 5x5 region
2. Select subset of gradients (below threshold)
3. Average color differences in the determined regions

Computational Photography

Hendrik Lensch, Summer 2007

## Gradients

$$\text{Gradient } S = |G18 - G8| + |R23 - R13| + |B19 - B9| / 2 + |B17 - B7| / 2 + |G24 - G14| / 2 + |G22 - G12| / 2$$

Computational Photography

Hendrik Lensch, Summer 2007

## Regions

selection: gradient  $< 1.5 \cdot \text{Min} + 0.5 \cdot (\text{Max} - \text{Min})$

e.g. {S,W,NE,SE}

S:  $R = (R13+R23)/2$ ,  $G = G18$ ,  $B = (B17+B19)/2$

NE:  $R = (R13+R5)/2$ ,  $G = (G4+G8+G10+G14)/4$ ,  $B = B9$

...

Computational Photography

Hendrik Lensch, Summer 2007

## Average

$R_{\text{sum}} = (R_s + R_w + R_{ne} + R_{se})/4$

$G_{\text{sum}} = (G_s + G_w + G_{ne} + G_{se})/4$

$B_{\text{sum}} = (B_s + B_w + B_{ne} + B_{se})/4$

average of color differences!

$G13 = R13 + (G_{\text{sum}} - R_{\text{sum}})$ ;  $B13 = R13 + (B_{\text{sum}} - R_{\text{sum}})$

Computational Photography

Hendrik Lensch, Summer 2007

## Correlation-Based Demosaicing

[Gunturk et al 02]

Subband decomposition of full RGB-image using

$$h_0 = [1 \ 2 \ 1]/4$$

$$h_1 = [1 \ -2 \ 1]/4$$

results in (LL, LH, HL, HH).

Observation: inter channel correlation of red/green and blue/green is larger than 0.9.

(discontinuities present in all channels at once!)

=> reconstruct (LH,HL,HH) for red and blue according to green

Computational Photography

Hendrik Lensch, Summer 2007

## Alternating Projections

1. Interpolate red, green, and blue
2. Decompose all three channels (LL,HL,LH,HH)
3. Update red and blue high frequencies  $i=(HL,LH,HH)$  according to green:

$$r_i = red_i - green_i \quad red_i = \begin{cases} green_i + T; & r_i > T \\ red_i; & |r_i| \leq T \\ green_i - T; & r_i < -T \end{cases}$$

4. Reset observed data
5. Iterate: goto 2 until stopping criterion achieved.
6. Reconstruct image

Computational Photography

## Demosaicing – Take-home-points

- 2/3 of your image are just made up!
- avg. 5% error, much larger for individual pixels
- color resolution is less than image resolution
- be careful with spiky BRDFs
- combining multiple video frames might help

Computational Photography

Hendrik Lensch, Summer 2007

## Flash-No-Flash [Eisenmann&Durand04]

[the following slides are from Eisenmann's SIGGRAPH talk]

Available light:  
+ nice lighting
