Project proposal (2 pages): 1st of June

- LaTeX Template will be made available

Project idea presentation: 8th of June

Final Project presentation: 20th of July

Project report

Computational Photography

Hendrik Lensch, Summer 2007

Advanced Processing Algorithms

- Graph Cuts
- Space-time manifolds
- Image-Based Priors

Computational Photography

Hendrik Lensch, Summer 2007

Image Segmentation

input image

labeling

- How to find an optimal labeling?
- How to provide connected regions?

Computational Photography

Hendrik Lensch, Summer 2007

Image Segmentation

input image

labeling

- based on similarity measure w_{ij}
- problem on graph
- look at two labels first

Computational Photography

Hendrik Lensch, Summer 2007

A Specialized Graph

- n-links
- favor similar labels for neighboring pixels

pixels
similarity between pixels

Computational Photography

Hendrik Lensch, Summer 2007

A Specialized Graph

- t-links: data term

Computational Photography

Hendrik Lensch, Summer 2007

A Specialized Graph

- t-links: data term

Computational Photography

Hendrik Lensch, Summer 2007

A Directed Graph

- minimize Potts energy $E(I) = \sum_{p \in P} |I_p - I_p^c| + \sum_{(p,q) \in N} K_{(p,q)} T(I_p \neq I_q)$

Computational Photography

Hendrik Lensch, Summer 2007

Graph Cut

- given graph $G = \{V, E\}$ with capacities $c(v_1, v_2)$
- s-t cut separates source and target

Computational Photography

Hendrik Lensch, Summer 2007

Minimum Cut

- determine cut with minimum energy
- equivalent to determining maximum flow

Computational Photography

Hendrik Lensch, Summer 2007

Graph Cut in 2D

(a) A graph \mathcal{G}

(b) A cut on \mathcal{G}

Computational Photography

Hendrik Lensch, Summer 2007

s-t Graph

- A source node and a sink node
- Directed edge $\langle i,j \rangle$ from node i to node j
- Each arc $\langle i,j \rangle$ has nonnegative capacity $c(i,j)$
- $cap(i,j) = 0$ for non-existing arcs

Computational Photography

Hendrik Lensch, Summer 2007

Flow in s-t Graph

Flow is a real value function f that assign a real value $f(i,j)$ to each arc such that

- capacity constraint: $f(i,j) \leq c(i,j)$
- mass balance constraint

$$\sum_{\langle i,j \rangle \in E} f(i,j) - \sum_{\langle k,i \rangle \in E} f(k,i) = \begin{cases} 0 & i \in V - \{s,t\} \\ |f| & i = s \\ -|f| & i = t \end{cases}$$

Computational Photography

Hendrik Lensch, Summer 2007

Flow in s-t Graph

- The maximum flow is the flow that has maximum value among all possible flow functions

Computational Photography

Hendrik Lensch, Summer 2007

s-t Cut

- A cut is a partition of node set V which has two subsets S and T
- A cut is a s-t cut iff $s \in S, t \in T$

Computational Photography

Hendrik Lensch, Summer 2007

Capacity of s-t Cut (cost)

$$cap([S,T]) = \sum_{\langle i,j \rangle \in E, i \in S, j \in T} cap(i,j)$$

Minimum cut is the s-t cut whose capacity is minimum among all possible s-t cuts

Computational Photography

Hendrik Lensch, Summer 2007

Residual Graph

The residual Graph G_f :

- $c_f(u,v) = c(u,v) - f(u,v)$
- update flow along the inversed arc

Computational Photography

Hendrik Lensch, Summer 2007

Residual Graph

The residual Graph G_r :

- $cf(u, v) = c(u, v) - f(u, v)$
- update flow along the inversed arc

Computational Photography

Hendrik Lensch, Summer 2007

Max-Flow / Min Cut

- If there are no augmenting path \rightarrow max flow
- S is the set of all vertices that are reachable from s in residual graph

Computational Photography

Hendrik Lensch, Summer 2007

Ford-Fulkerson Algorithm

compute Residual Graph

repeat

- find a direct path in G_f from source to sink in a depth-first search
- augment the flow of this path by an amount corresponding to the minimum residual capacity of the edges along this path
- update residual graph

until no augmenting paths exists

Computational Photography

Hendrik Lensch, Summer 2007

Ford-Fulkerson Algorithm I

Computational Photography

Hendrik Lensch, Summer 2007

Ford-Fulkerson Algorithm II

Computational Photography

Hendrik Lensch, Summer 2007

Ford-Fulkerson Algorithm III

Computational Photography

Hendrik Lensch, Summer 2007

Ford-Fulkerson Algorithm IV

Computational Photography

Hendrik Lensch, Summer 2007

Ford-Fulkerson Algorithm IV

Further Demonstration

Computational Photography

Hendrik Lensch, Summer 2007

Extension to multiple labels

- start with random labeling
- iterative execution of the min-cut for each label α
- try to increase the number of α labels such that $E(f') \leq E(f)$
- α -expansion
- stop when no further update

[Boykov 01/02]

Computational Photography

Hendrik Lensch, Summer 2007

Applications

- denoising
- image-segmentation
- stereo
- texture synthesis
- ...

Computational Photography

Hendrik Lensch, Summer 2007

Denoising

(a) Diamond restoration (b) Original *Bell Quad* (c) "Restored" *Bell Quad*

[Boykov 1999]

Computational Photography

Hendrik Lensch, Summer 2007

Stereo Reconstruction

[Boykov 1999]

Computational Photography

Hendrik Lensch, Summer 2007

Patch-based Texture Synthesis

[Kwatra 03]

Computational Photography

Hendrik Lensch, Summer 2007

Patch-based Texture Synthesis

- minimize the energy across seams

[Kwatra 03]

Computational Photography

Hendrik Lensch, Summer 2007

Patch-based Texture Synthesis

- insertion into existing region

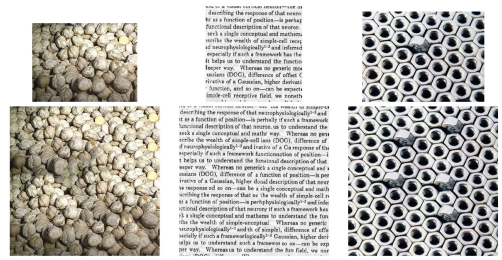

[Kwatra 03]

Computational Photography

Hendrik Lensch, Summer 2007

Space-time Manifolds

[Wexler 05]

Computational Photography

Hendrik Lensch, Summer 2007

Space-time Manifolds

- how to extract this panorama?

[Wexler 05]

Computational Photography

Hendrik Lensch, Summer 2007

Space-time Manifolds

- determine optimal path through the space-time volume

[Wexler 05]

Computational Photography

Hendrik Lensch, Summer 2007

Algorithm

- transition from one column to the next within a frame is always possible
- transition from one frame to the next only allowed if some similar transition is found within one of the input frames:

$$D(\psi_f^i, \psi_g^j) = \min_n \min_{UV \subset \Psi_n} \|UV - \psi_f^i \psi_g^j\|$$

- simplified cost:

$$D(\psi_f^i, \psi_g^j) \leq C(\psi_f^i, \psi_g^j) = \min \left\{ \begin{array}{l} \|\psi_f^i \psi_g^j - \psi_f^i \psi_g^{j+1}\|, \\ \|\psi_f^i \psi_g^j - \psi_f^{i-1} \psi_g^j\| \end{array} \right\} \\ \min \left\{ \|\psi_g^j - \psi_g^{j+1}\|, \|\psi_f^i - \psi_f^{i-1}\| \right\}$$

Computational Photography

Hendrik Lensch, Summer 2007

Algorithm

- find shortest path between selected start and end column

Computational Photography

Hendrik Lensch, Summer 2007

Hole Filling in Videos

Computational Photography

Hendrik Lensch, Summer 2007

Space-time Video Completion

Computational Photography

Hendrik Lensch, Summer 2007

Local Space-time Consistency

- fill up each voxel such that its space-time neighborhood matches a neighborhood in the input video
- make sure that this is true for all neighborhoods containing the voxel

Computational Photography

Hendrik Lensch, Summer 2007

Algorithm

- Input: video S , hole $\mathcal{H} \subset S$, database \mathcal{D} .
- Compute space-time pyramids $S_i, \mathcal{H}_i, \mathcal{D}_i, l = 1..L$.
- $t \leftarrow 0, S^t \leftarrow S$
- for pyramid level l , from top to bottom do
- repeat
- for all $p \in \mathcal{H}_l$ do
- Let $\{W_p^l\}_{i=1}^k$ be all windows s.t. $p \in W_p^l$
- Find $\{V^l\} \subseteq \mathcal{D}_l$ maximizing Eq. (2)
- Let $c^l \in V^l$ be the appropriate colors.
- Set $\omega_p^l = \alpha_p^l \cdot \text{sim}(W_p^l, V^l)$.
- $S^{l+1}(p) \leftarrow ML(c^l, \omega_p^l)$ using Eq. (4)
- end for
- $t \leftarrow t + 1$
- until convergence
- Propagate solution to the next level
- end for
- Output: S^L

$$\text{sim}(W_p, V_p) = e^{-\frac{\sum_{i,j} |w_{ij} - v_{ij}|}{\sum_{i,j} w_{ij}}}$$

$$c = \frac{\sum_{i \in M} \omega_p^i c^i}{\sum_{i \in M} \omega_p^i}$$
